Algoma Invests \$700M in Transition to Electric Arc Steelmaking

In November, 2021 Algoma Steel Inc. announced its decision to invest CDN \$700 million in the transition to electric arc steelmaking. Two state-of-the-art electric arc furnaces will replace its existing basic oxygen steelmaking operations and result in the elimination of cokemaking.

Anticipated Benefits of Electric Arc Steelmaking

Improved Competitiveness

- ▶ Creates cost competitive platform for growth and value-add downstream opportunities by increasing our annual liquid steel production capacity from 2.8 to 3.7 million tons.
- ▶ Reduces sustaining capital requirements allowing more opportunity for investment.
- ▶ Offers scalable operating model and cost structure.
- ▶ Reduces exposure to carbon taxes
- ▶ Eliminates the risk associated with a single furnace operation.

Builds our Organization and Community

- ▶ Delivers a modernized workplace with skills development and succession opportunities.
- ▶ Creates at least 500 new construction jobs in the region.
- ▶ Provides more apprenticeships, co-op placements, and high-skill career opportunities.

Makes us a financially sustainable producer and employer for generations to come.

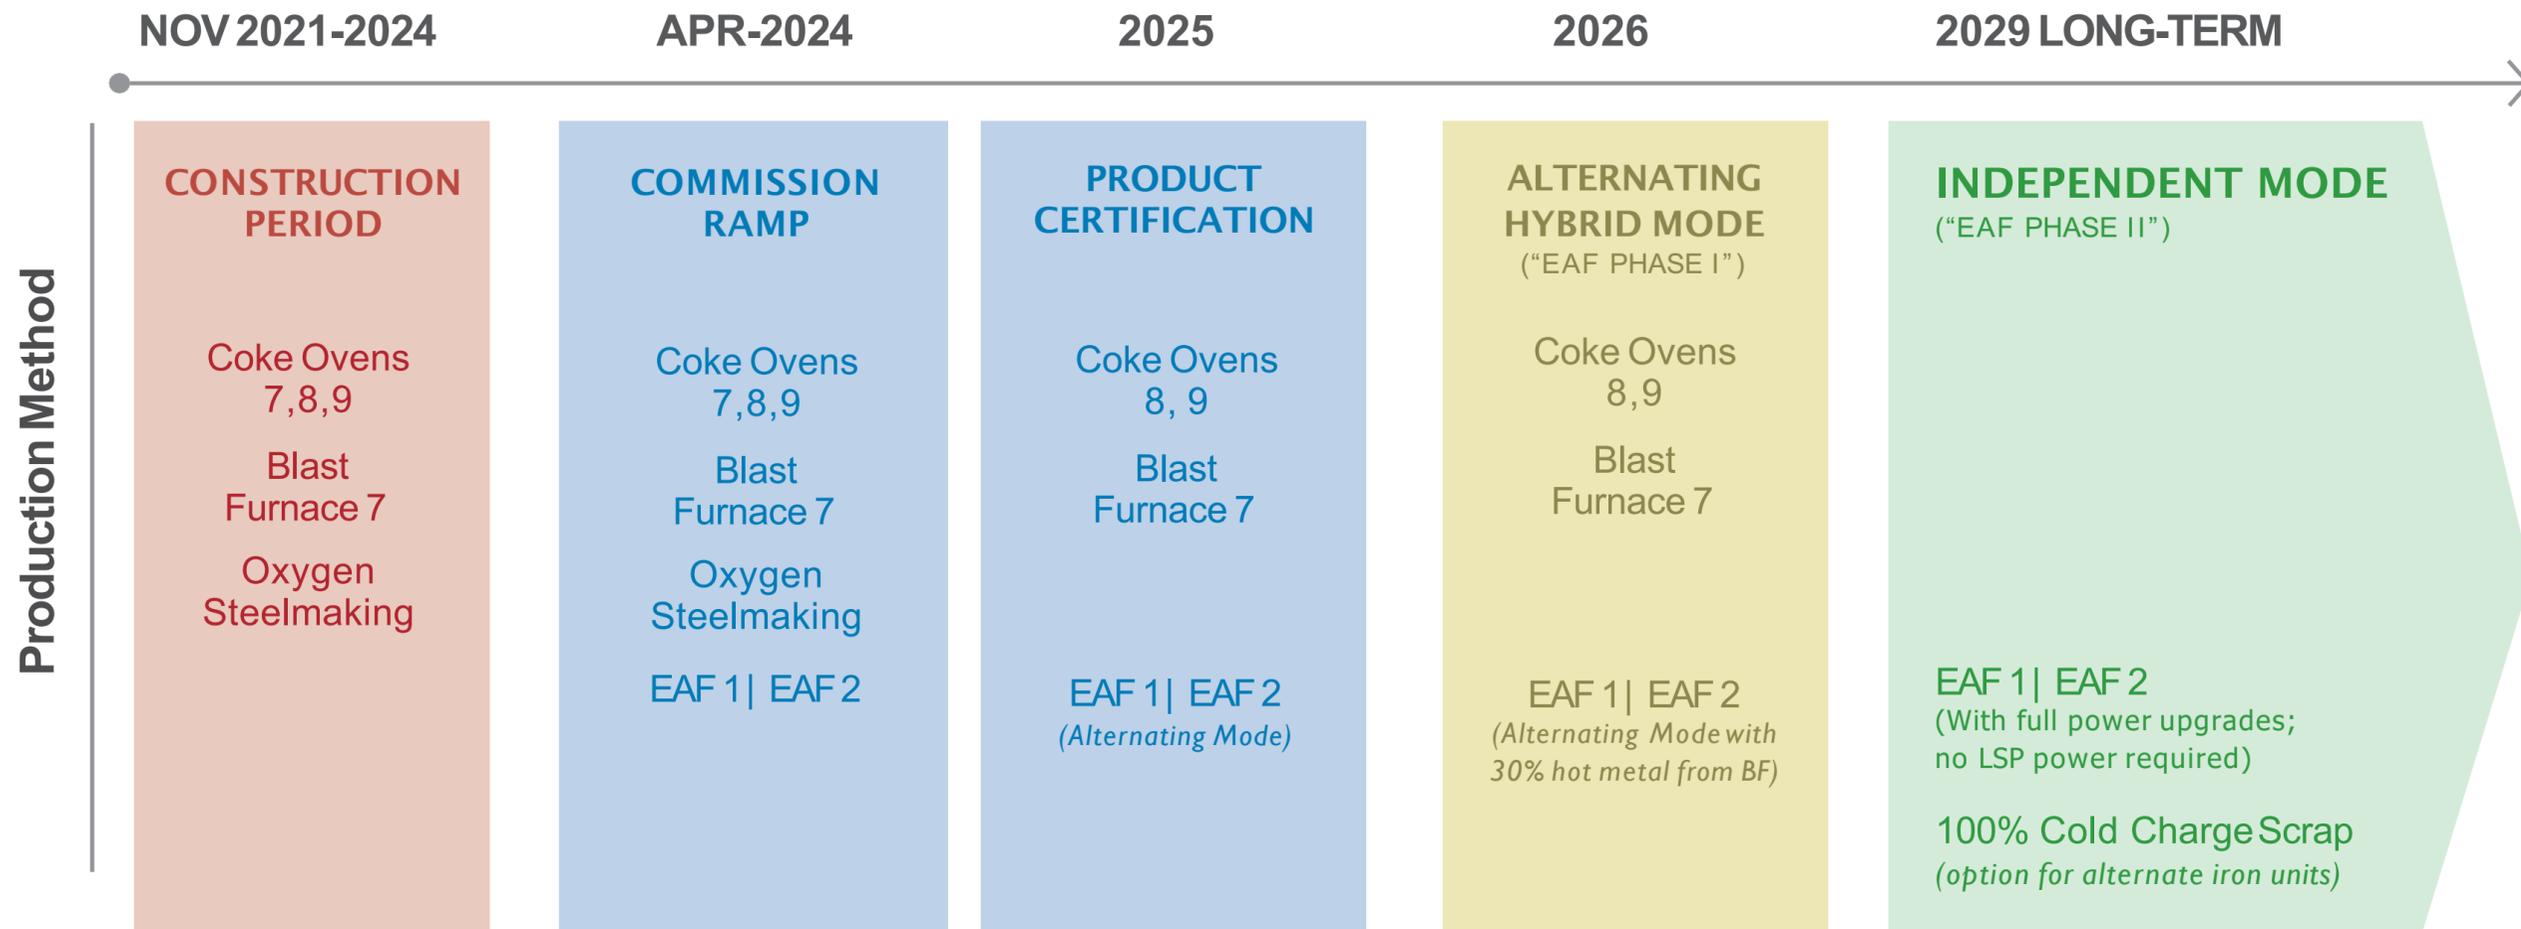

When paired with Ontario's low-carbon power grid, it would make Algoma Steel the leading producer of green steel in Canada, and among the top suppliers in North America.

Shrinks our Environmental Footprint

- ▶ Reduces our greenhouse gas emissions by up to 70%
- ▶ Eliminates emissions associated with coke-making

Proposed Operational Transition to Electric Arc Steelmaking

Phase I

Operations would alternate arcing on one furnace at a time with approximate 30% hot metal charge from No. 7 Blast Furnace (which is operating at reduced output). Powered by the on-site LSP power generation and excess grid power from the local 230kV transmission upgrade.

Phase II

Operate both electric arc furnaces simultaneously with 100% cold charge, including obsolete and prime scrap with option for addition of alternate iron units, such as HBI or pig iron as required. Fully powered by the Ontario grid. On-site power generation not required.

Note: 2025 onwards, No. 7 Blast Furnace will operate at a lower rate.

Algoma's Shrinking Environmental Footprint

Transition to Electric Arc Steelmaking

Algoma Steel has committed to transition its manufacturing process from the integrated basic oxygen steelmaking route to electric arc steelmaking. This process change will shrink Algoma's environmental footprint dramatically, **reducing greenhouse gas emissions by up to 70%⁽¹⁾** and positioning Algoma as one of the leading producers of green steel in North America.

Other benefits include:

Quieter

Fewer noise sources.

Less Waste

Fewer by-product streams.

Cleaner Water

Fewer effluent discharges.

Cleaner Air

Lower emissions from fewer sources.

		Preliminary Estimated Reduction⁽¹⁾	% Reduction
GHG Emissions	C₀₂	3.0 MM tonnes	70%
	C₀₂/NTproduction	1.33 tonnes	75%
SO_x Emissions		4,060 tonnes	82%
NO_x Emissions		1,604 tonnes	52%
Cokemaking Emissions		Complete elimination of Cokemaking Stack and Fugitive Emissions	100%

Note (1): Source: Company information. Expected environmental benefits from the EAF are based on projected estimates for Algoma, using published data sources for similar technologies. Estimated benefits based on current production versus forecasted production of 3.0MM tons of steel shipments produced under full, exclusive EAF configuration.

Transition to Electric Arc Furnace Steelmaking

Applications for Environmental Compliance Approvals

Algoma Steel will be applying for the following approvals:

1

Site wide **Environmental Compliance Approval** for **air and noise** based on the planned progressive shutdown of equipment and facilities associated with the transition to electric arc furnace steelmaking.

Application to include:

- ▶ Two new EAF exhaust treatment plants including baghouses
 - ▶ A new cooling tower
-

2

Amendment to the existing **industrial sewage works Environmental Compliance Approval** that incorporates:

- ▶ New recirculating non-contact cooling water system (with a small blowdown to the existing water treatment facility)
- ▶ No new contaminant loading to the existing treatment facility

Over the course of the transition, contaminant loading to the water treatment facility will decrease.

Up to five existing effluent discharges and up to 7 existing noise sources will be eliminated.

Pending Site Specific Standard Requests

New Site-Specific Standards will govern the operating transition to electric arc steelmaking

- ▶ By the end of March 2022, Algoma will be submitting a request for amended site-specific standards for benzene, benzo(a)pyrene, and particulate matter. The new standards will reflect changes to the air emission dispersion model that have resulted in an increase in modeled emissions.
- ▶ Model updates include:
 - Newest model version (province-wide)
 - Data reflecting more recent meteorological conditions
 - Changes to the land use designation from urban to rural to more accurately reflect local land use
- ▶ Algoma's request will include a continuous improvement plan that provides for the substantial reduction or elimination of emissions as a result of the progressive shutdown of equipment and facilities in the transition to electric arc steelmaking.
- ▶ Site-Specific Standards (SSS) are government approved standards issued to facilities that are implementing a continuous improvement plan towards reducing the emissions of specific contaminants.
 - Site Specific Standards provide a compliance approach for existing facilities when new limits are imposed in regulations that they are unable to meet with their existing technology.
 - The SSS's set out a plan for these facilities that progressively moves them towards meeting the new limits.

New Site Specific Standard Request

Sulphur Dioxide (SO₂)

A new provincial standard for SO₂ comes into force in July 2023.

- ▶ Existing integrated steelmaking facilities in Ontario cannot achieve this new standard.
- ▶ Both the federal and provincial governments have announced they will require Coke Oven Gas Desulfurization by January 1, 2026 as a means to reduce SO₂ emissions from integrated iron and steel making facilities.
- ▶ Algoma will be taking an alternative approach to reduce SO₂ through its transition to electric arc steelmaking, which will see the elimination of cokemaking from Algoma's operations. Therefore, Algoma will be applying for a Site-Specific Standard that includes an action plan to reduce SO₂ that reflects the progressive facility shutdown.
- ▶ In the interim and throughout the transition, Algoma will continue to operate its facilities in compliance with the requirements of all Environmental Compliance Approvals and Site-Specific Standards.

Progressive Reduction in Modeled Emissions

Transition to Full Compliance to the Standard

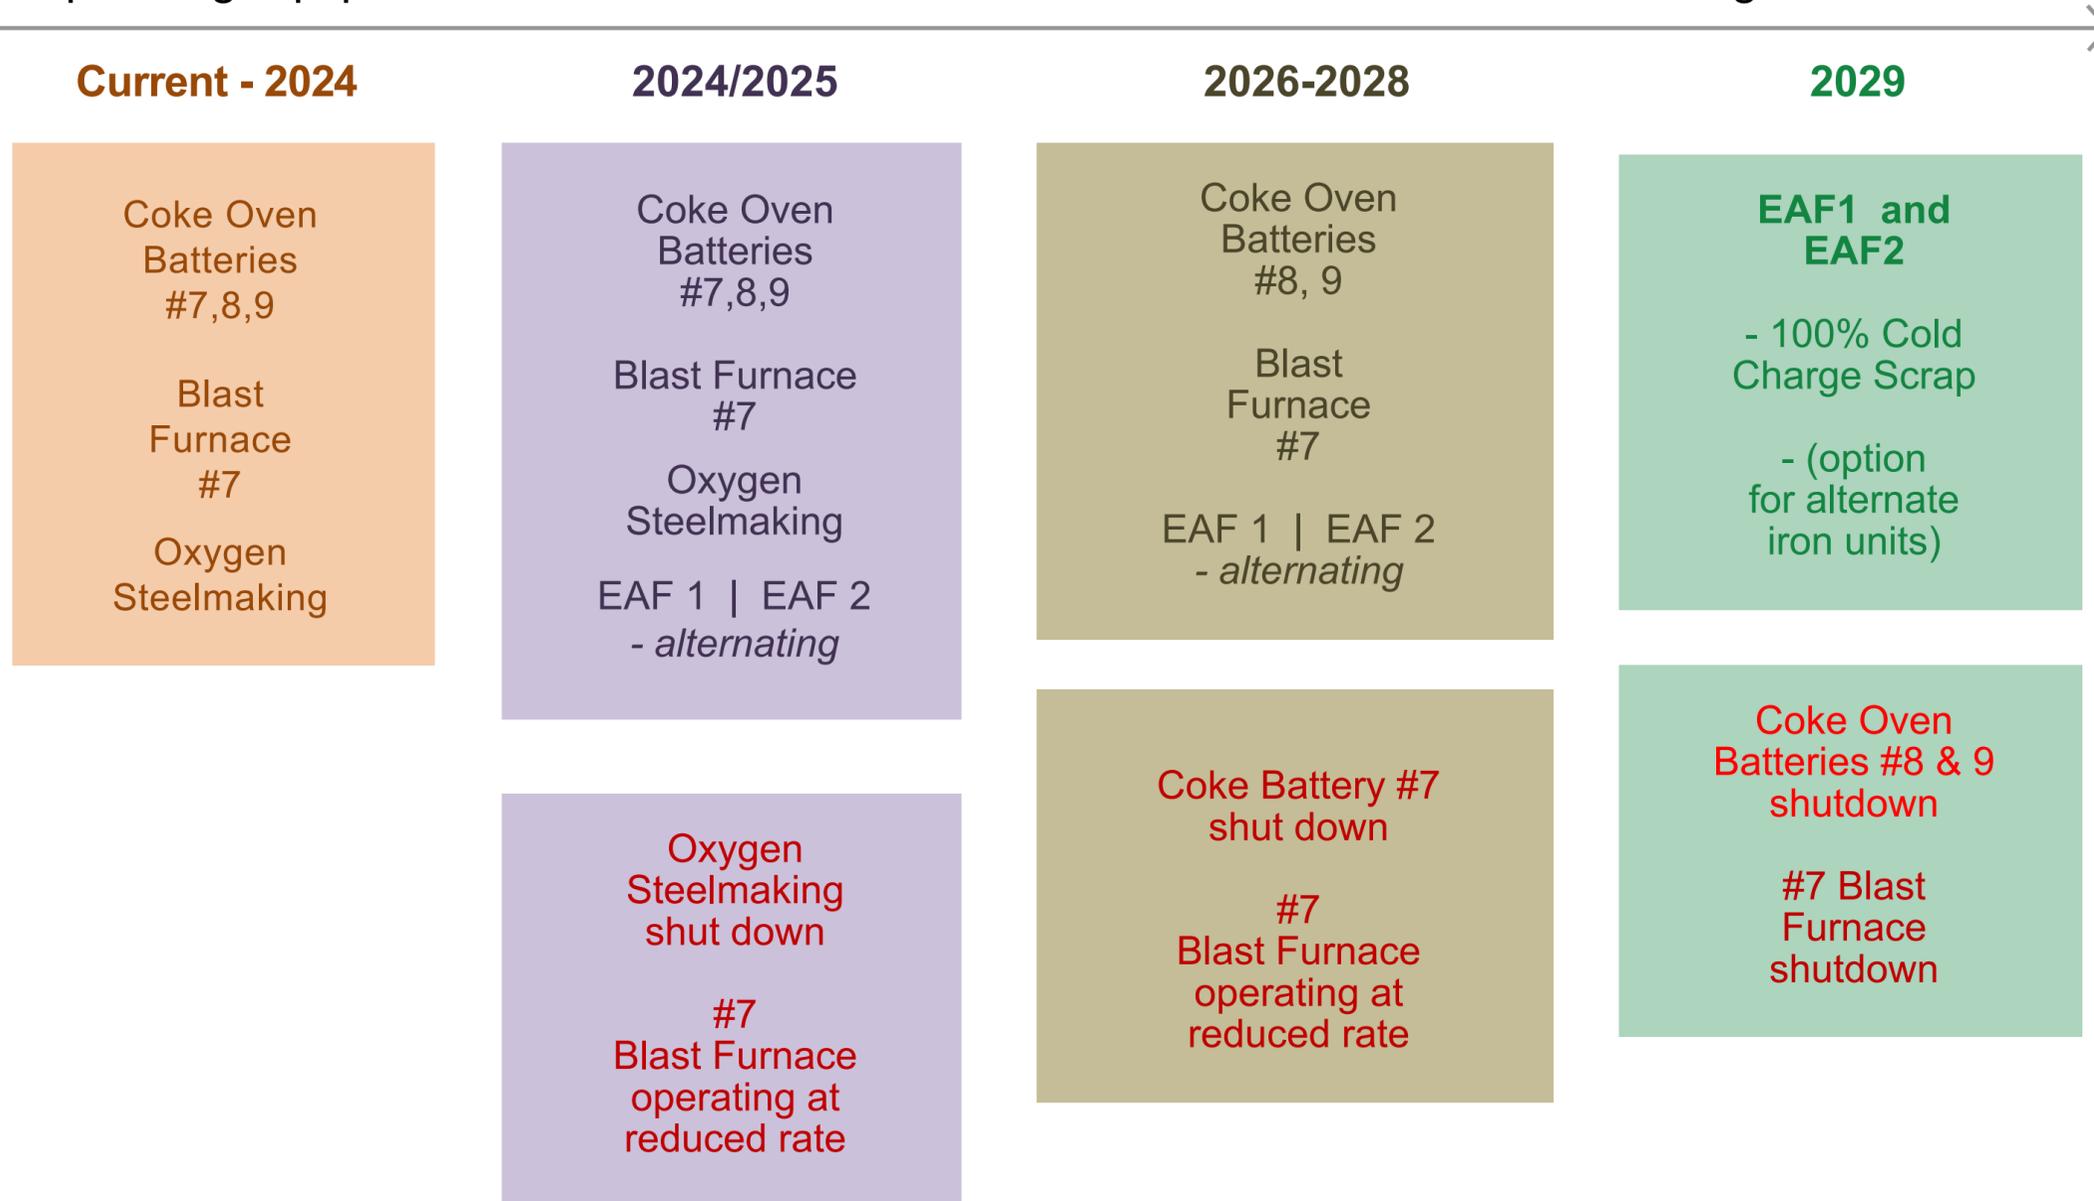

Contaminant	Averaging Period	MECP Point of Impingement Limit ($\mu\text{g}/\text{m}^3$)	Maximum Predicted POI Concentration ($\mu\text{g}/\text{m}^3$)			
			Current-2024	2024/2025	2026-2028	2029 Onwards
Benzene	Annual	0.45 (2.2 SSS)	3.99	3.99	3.21	0.11
Benzo(a)pyrene	Annual	0.00001 (0.004 SSS)	0.0053	0.0053	0.0045	0
Sulphur dioxide	1 hour	690 (current) 100 (as of Jul,2023)	597	525	432	70
Sulphur dioxide	Annual	No current limit 10 (as of Jul, 2023)	34	23	18	3
Particulate matter	24 hour	120 (127 SSS)	135	132	121	36

- ▶ Algoma Steel is applying for updated Site Specific Standards for benzene, B(a)P and particulate matter and a new Site Specific Standard for sulphur dioxide. These would apply to the interim period, allowing for the planned progressive shutdown of equipment and facilities associated with the transition to electric arc steelmaking.
- ▶ The transition to electric arc steelmaking will eliminate coke-making emissions.
- ▶ We expect the facility will meet Ontario Regulation 419 Schedule 3 criteria when it reaches EAF independent mode. At that time, Site Specific Standards will no longer be required.

Progressive Transition to Electric Arc Steelmaking

Operating equipment included in the modeled transition to electric arc steelmaking.

Terminology:

MECP

Ministry of Environment, Conservation and Parks

POI

Point of Impingement: any point outside the Company's property boundaries at which the highest concentration is expected to occur

µg/m³

The concentration of an air pollutant is given in micrograms (one-millionth of a gram) per cubic meter of air

Air Emission

Dispersion Modeling

computes the maximum concentrations of contaminants emitted from a facility assuming all equipment is operating at full capacity. Factors that impact the transport of contaminants in the atmosphere such as meteorological conditions, site configuration, emission release characteristics and surrounding terrain are incorporated into the computer modeling.

Technology Benchmarking Report

Site-Specific Standard Application

What is it?

- ▶ Assessment of feasible pollution control options to reduce emissions, benchmarking against approaches used at other facilities across the globe.
- ▶ Electric arc steelmaking and other pollution control options were considered

Examples of Air Pollution Control Options and Best Practices

Best Practice (Green highlights = already installed)		Benzene	Benzo(a)pyrene	Particulate Matter	Sulphur Dioxide
Electric arc steelmaking		✓	✓	✓	✓
Gas desulphurization					✓
ALREADY INSTALLED	Individual Oven Pressure Control technology	✓	✓	✓	
	Leak detection and repair program	✓	✓	✓	✓
	Emissions collection and treatment system (e.g., scrubber)	✓	✓		✓
	Dust collection system			✓	
	Water/dust suppressant during material transfer, on roadways and stockpiles			✓	

What are the outcomes of the report?

- ▶ Dispersion modelling demonstrates compliance is best met for all contaminants using electric arc steelmaking
- ▶ Other identified best management practices are planned for implementation including enhanced dust suppression
- ▶ Some pollution control options were ruled out due to lack of technical or economic feasibility

Community Engagement

Website: www.algoma.com

A section of the Algoma Steel website is dedicated to sharing information with the public related to Algoma's environmental management program. Here stakeholders can find various public reports, air quality data, Open House exhibits, presentations made to the Community Liaison Committee and a direct link to the company (environment@algoma.com) to report a concern or make an inquiry.

Annual Community Open House Events

Algoma Steel hosts annual Environmental Open Houses to meet with members of the community and share updates on Algoma's environmental management program, including information regarding pending applications for new or amended environmental compliance approvals or site specific standards.

Community Liaison Committee

Algoma Steel established a Community Liaison Committee in 2008 to provide a forum for the communication of relevant environmental information, facilitating another opportunity for the exchange of information between the community and the company with respect to the environment. Representatives from interested community organizations and the general public meet on a quarterly basis. Meeting presentations and minutes are shared on the company website.

Ontario Environmental Registry: <https://ero.ontario.ca/>

All Algoma Steel applications for new or amended environmental compliance approvals or site specific standards are posted to the Ministry of Environment, Conservation and Parks' Environmental Registry for public information and comment.
